9	Chapter 1 Lesson 1: The Science of Biology							
	0	What	t Science IS and is NOT:					
			You need to understand that <u>Scientific knowledge</u> is always					
			<u>changing</u>					
			Science is a human process of trying to <u>understand</u> the world					
			around us.					
	<ul> <li>Like all Science, Biology is a process ofinquiru</li> </ul>							
			<ul> <li>It is based on both <u>curiosity</u> and <u>skepticism</u></li> </ul>					
	• What are the GOALS of science?							
			The goal of science is to provide natural and <u>testable</u>					
			explanations for natural events.					
			Science also uses explanations that are supported by <u>data</u>	to				
			understand patterns in nature.					
			<ul> <li>Scientific explanations can then be used to make useful</li> </ul>					
			predictions about natural events.					
	0	Can S	Science answer ALL questions?					
			No!					
			Some answers to questions are left up to <u>opinion</u> .					
			• Examples:					
			O Remite					

· Celestial Predictions: Horoscopes

· Luck = Black Cat

ntific Methodology: What does Methodology mean????							
Methodology is a system of <u>methods</u> used in a particular							
area of study or activity.							
So Scientific Methodology is the new "trendier" version of the old school							
term = Scientific Method.							
<ul><li>The Scientific Method:</li></ul>							
<ul> <li>Common set of steps that biologist and other scientist use to gather info and answer questions.</li> </ul>							
							<ul> <li>It is not a rigid approach, it is not fixed. It is actually very</li> </ul>
free flowing (common sense).							
<ul> <li>Scientific Methodology: Broken down</li> </ul>							
<ul> <li>All scientific inquiries begin with <u>careful abservations</u></li> </ul>							
<ul> <li>Observation:</li> </ul>							
Using your senses to study the world.							
o From our observations: data can be collected and analyzed.							
■ Two Types of <u>Data</u> :							
<ul> <li>Qualitative = Descriptive data</li> </ul>							
<ul> <li>Quantitative = Anything that can be expressed by #'s.</li> </ul>							
<ul> <li>Hypothesis = A proposed answer for a scientific question</li> <li>A hypothesis leads to         <ul> <li>testable predictions of what would happen if the hypothesis is valid.</li> </ul> </li> <li>Testing a Hypothesis:</li> <li>This is called an Experiment.</li> </ul>							

- One test of the hypothesis is not enough. Why????
- Experiments must be repeatable
- Experiment = A test of a hypothesis
  - o Constants =
    Things that are held/kept the same.
  - o Variables = Anything that changes during an experiment.
  - Independent Variable
    - This is what you change.
    - It is the thing that you are <u>testing</u>
  - Dependent Variable
    - Are observed and <u>measured</u>
       during and experiment.
    - They are the changes that occur because of what \_\_\_\_\_\_\_ changed.
    - Dependent variables <u>depend</u> on the independent variable

exhitizer example given.

## Experiment: Example and Practice

- Constants:
- Independent Variable:
- Dependent Variable:

\* Define Control:

Part of the experiment
that does not receive the
test or treatment. In the
end, you use it do a comparison
for your experimental results.

•	A scientific <u>explanation of events</u>	in the natural
•	They come from many repeated	hange as more
Review, Synthesize, Inf	er and Summarize:	
1. In your own v	vords, define the term science.	
2. Why is there i	no one correct process of scientific inves	tigation?
3. Why are hypo	otheses so important to controlled experi	iments?
4. What is a scie	ntific theory?	
5. How does a th	neory differ from a hypothesis?	

Scientific Theory:

## **Chapter 1 Lesson 2: Science in Context**

- Lesson Summary: The process of science includes...
  - Exploration and discovery
  - Community analysis and feedback
  - Benefits and outcomes.
- Biologist, like all scientists, ask questions about the world and try to find answers through observations and experimentation. How do your daily observations help answers questions that you have about the world?

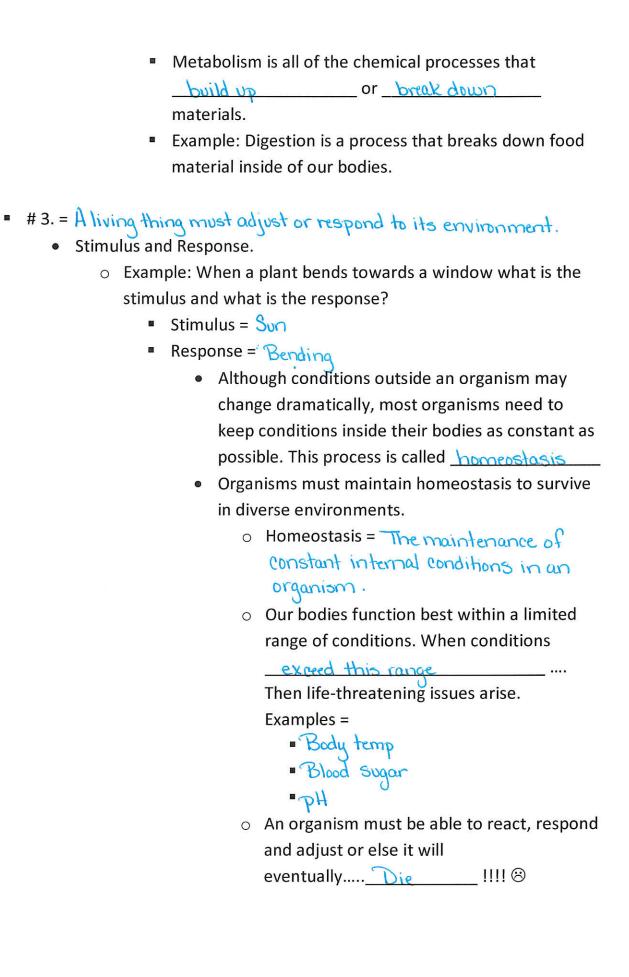

0

•	Like all Science,	Biology is a proc	ess of inquir	y. It is based o	n both
			A V		

 <u>Curiosity</u> and <u>Skepticism</u>.
 Scientific attitudes that help scientists and engineers ask new questions and define new problems:

- Curiosity
- Skepticism
- Dpen-mindednessCreativity
- **Science and Society:** 
  - Science interacts with
    - · Society
    - · Laws
    - Moral principles
  - O Science also has a big impact on
    - · Health issues
    - · Medical issues
    - · Environmental issues

Science and Ethical Concerns:	
o Ethics = Standards for what is accepted as right 4 wrong.	
, 3	
<ul> <li>Group Discussion = Why and How do ethics play a role in science?</li> </ul>	
Is it okay to kill for a cure???	
Avoiding Bias in Science:	
<ul> <li>Bias = A <u>personal view</u> for or against something.</li> </ul>	
<ul> <li>Bias comes from the French word <u>biais</u> meaning "<u>slant</u></li> </ul>	"
or " <u>slope</u> ".	
<ul> <li>Important! Please read through Chapter 1 Lesson 2 thoroughly. It does contain som</li> </ul>	e
material that may be on the test that was not covered through lecture.	
Chapter 1 Lesson 3: Patterns of Life	
Biology = The study of life	
o Bio = Life	
o logy = Study of	
An organism is defined as any individual thing.	
But how do we DEFINE living?????	
<ul> <li>Characteristics of Living things:</li> </ul>	
# 1 = Made of one or more cells.	
• Cells = Basic units of life.	
<ul> <li>Each cell contains the genetic material = <u>DNA</u></li> </ul>	
<ul> <li>DNA provides the info needed to control an organism's</li> </ul>	>
life processes.	
#2 = Living things Need Energy.	
All organisms need <u>Chemical energy</u> to carry out life	
processes.	
<ul><li>What is Energy???</li></ul>	
<ul> <li>The ability to do!</li> </ul>	
<ul> <li>All of the "work" or processes that go on inside the body is</li> </ul>	
known as <u>metabolism</u> .	

0 #4. = Reproduce & Develop

- Reproduction:
  - Reproduction is not essential for individual survival but what would happen if no organisms reproduced?
  - · For life to continue, organisms must
  - Two main types of reproduction:
    - Sexual Reproduction:
      - Involves the fusion of cells from two different parents.
    - Asexual Reproduction:
      - Only requires one parent

We will explain properly.

- Development:
  - As organisms grow they also develop.
     Development leads to mature organisms
     that can usually reproduce.
